

C++ Development using Docker

Pieter P

This is a guide on how to set up a C++ cross-compilation toolchain and development environment. It serves as the documentation for the [RPI-Cpp-Toolchain](#) repository.

The first page guides you through the installation of the necessary tools and editors.

The second and third page explain how to build a cross-compilation toolchain using Crosstool-NG, and how to use it to compile the following libraries:

- **Zlib**: compression library (OpenSSL and Python dependency)
- **OpenSSL**: cryptography library (Python dependency)
- **FFI**: foreign function interface (Python dependency, used to call C functions using ctypes)
- **Bzip2**: compression library (Python dependency)
- **GNU ncurses**: library for text-based user interfaces (Python dependency, used for the console)
- **GNU readline**: library for line-editing and history (Python dependency, used for the console)
- **GNU dbm**: library for key-value data (Python dependency)
- **SQLite**: library for embedded databases (Python dependency)
- **UUID**: library for unique identifiers (Python dependency)
- **libX11**: X11 protocol client library (Tk dependency)
- **Tcl/Tk**: graphical user interface toolkit (Python/Tkinter dependency)
- **Python 3.8.3**: Python interpreter and libraries
- **ZBar**: Bar and QR code decoding library
- **Raspberry Pi Userland**: VideoCore GPU drivers
- **VPX**: VP8/VP9 codec SDK
- **x264**: H.264/MPEG-4 AVC encoder
- **Xvid**: MPEG-4 video codec
- **FFmpeg**: library to record, convert and stream audio and video
- **OpenBLAS**: linear algebra library (NumPy dependency)
- **NumPy**: multi-dimensional array container for Python (OpenCV dependency)
- **SciPy**: Python module for mathematics, science, and engineering
- **OpenCV 4.3.0**: computer vision library and Python module
- **GDB Server**: on-target remote debugger
- **GCC 9.2.0**: C, C++ and Fortran compilers
- **GNU Make**: build automation tool
- **Ninja**: faster, more light-weight build tool
- **CMake**: build system
- **Distcc**: distributed compiler wrapper (uses your computer to speed up compilation on the RPi)
- **CCache**: compiler cache
- **cURL**: tool and library for transferring data over the network (Git dependency)
- **Git**: version control system

Next, page four explains how to install these libraries to the Raspberry Pi.

The fifth helps you set up Visual Studio Code for cross-compilation and remote debugging.

The sixth page presents a small "hello world" example project in C++ that uses CMake and Google Test.

Finally, there's a page on remote on-target debugging using GDB and Visual Studio Code.

If you're in a hurry, or if you are already quite familiar with Linux, compilers, etc. you can skip straight to the "Speedrun" page, it contains all the commands you need to get the entire project running in just a couple of minutes.

Installation and setup

Installing the necessary tools and dependencies.

Building the Cross-Compilation Toolchain

To compile software for the Raspberry Pi, you need a cross-compilation toolchain. This page contains instructions for how to build one.

Cross-Compiling the Dependencies

Using the cross-compilation toolchain to build the libraries you need for your project, as well as their dependencies.

Installing the dependencies on the Pi

Installing the cross-compiled libraries from the previous step on the Raspberry Pi.

Setting up Visual Studio Code for C++ Development

Installing and configuring the right extensions for easy C++ development in VSCode.

Cross-Compiling the C++ Example Project

Using the cross-compilation toolchain to build your own C++ project.

Speedrun

Installing, building and setting everything up as fast as possible, in just a few commands.
