# GoogleTest

Pieter F

This page explains how to install the Google Test framework on Ubuntu.

## Install dependencies and tools

First, install GCC, CMake, GNU Make and Git if you haven't already.

```
$ sudo apt update
$ sudo apt install gcc g++ cmake make git
```

### Download, build and install

```
#!/usr/bin/env bash
    # Script to download and install GoogleTest
6
    version="release-1.10.0" # Release tag on GitHub
    prefix="$HOME/.local"
8
    cd /tmp
    git clone --single-branch --depth=1 --branch "$version" \
13
        https://github.com/google/googletest.git
14
    mkdir googletest/build && cd $_
    # Configure
   cmake .. -DCMAKE_INSTALL_PREFIX="$prefix" -DCMAKE_BUILD_TYPE=Release
16
    # Build
17
   make -j$(nproc)
18
19
    # Install
    make install
```

#### Usage

To use GoogleTest in your project, you can use the following CMake snippet:

```
enable_testing()
find_package(GTest REQUIRED)
include(GoogleTest)

add_executable(test-exe test.cpp) # test.cpp contains TEST(...) cases
target_link_libraries(test-exe PRIVATE GTest::gtest_main)

if(NOT CMAKE_CROSSCOMPILING)
gtest_discover_tests(test-exe)
endif()
```

CMake has to find GoogleTest, so you need to make sure that \$HOME/.local is in its search paths. See <a href="Installing Locally">Installing Locally</a>.

#### Tested on

• Ubuntu 19.10 - GoogleTest 1.10.0
