Installing Locally

Pieter F

When installing packages locally, you might have to set up some paths. It's easiest to just add them to your ~/.profile file.

.profile

```
\# set PATH so it includes user's private bin if it exists
 1
     if [ -d "$HOME/bin" ] ; then
PATH="$HOME/bin:$PATH"
 3
     if [ -d "$HOME/.local/bin" ] ; then
           PATH="$HOME/.local/bin:$PATH"
     export PATH
     # set MANPATH so it includes user's private man if it exists
if [ -d "$HOME/.local/man" ] ; then
     MANPATH="$HOME/.local/man:"
10
11
12
13
     if [ -d "$HOME/.local/share/man" ]; then
MANPATH="$HOME/.local/share/man:$MANPATH"
15
16
17
     export MANPATH
18
     # set PKG_CONFIG_PATH so it includes user's private pkgconfig if it exists
if [ -d "$HOME/.local/lib/pkgconfig" ] ; then
    PKG_CONFIG_PATH="$HOME/.local/lib/pkgconfig:$PKG_CONFIG_PATH"
19
20
21
22
23
     if [ -d "$HOME/.local/share/pkgconfig" ] ; then
           PKG_CONFIG_PATH="$HOME/.local/share/pkgconfig:$PKG_CONFIG_PATH"
24
25
     export PKG_CONFIG_PATH
27
28
     # set CMAKE_PREFIX_PATH so it includes user's private prefix if it exists
     if [ -d "$HOME/.local" ]; then
29
           CMAKE_PREFIX_PATH="$HOME/.local:$CMAKE_PREFIX_PATH"
30
31
     export CMAKE_PREFIX_PATH
```

The PATH variable specifies the search path where your system looks for executables and binaries. https://help.ubuntu.com/community/EnvironmentVariables

The MANPATH variables specifies the directories that contain documentation for the man command. $\underline{\text{http://manpages.ubuntu.com/manpages/focal/en/man1/manpath.1.html}$

The PKG_CONFIG_PATH variable allows the pkg-config tool to find locally installed libraries. http://manpages.ubuntu.com/manpages/focal/en/man1/pkg-config.1.html

The CMAKE_PREFIX_PATH variable allows CMake to find locally installed libraries and tools. https://cmake.org/cmake/help/latest/variable/CMAKE_PREFIX_PATH.html
